

Enabling active load management for next-generation demand response

Some utilities are embarking on the second phase of demand response. They are no longer looking at demand management as a passive sideline component of their business. Changes in consumption, the integration of renewables, and more sophisticated control technologies are introducing the opportunity for utilities to more actively manage demand.

OMNETRIC active load management solution

- Identify how much curtailable or consumable load exists
- Automatically initiate, dispatch and control load control programs in times of need
- Increase or decrease consumption depending on grid needs
- Employ near real-time verification methods to validate if load provided balances the grid
